Guidelines in Thesis Writing

Prepared by:

Research and Development Center

Edited by:

Jolal R. Garcia-Bolaños, PhD

May 2024

PREFACE

Writing a thesis is an essential requirement for earning a Bachelor's or Master's degree. It is a scientific endeavor that necessitates following a step-by-step procedure. At Notre Dame of Midsayap College, the thesis format has often been a source of difficulty, as there are various formats and structures being followed by researchers. To address this issue, the NDMC Research and Development Center has developed a comprehensive format for thesis writers to follow.

The content of this format is elaborated, exemplified, and illustrated in a manner that is easily understandable for researchers.

Certificate of Authentic Authorship 2 lines, single space

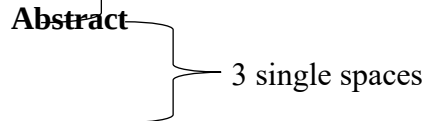

I hereby declare that, this submission is the result of my efforts. It contains no previously published or written materials by another individual, nor material that has been accepted for the award of any degree or diploma at Notre Dame of Midsayap College or any other educational institution unless due acknowledgement is made in the research. The paper explicitly acknowledges any contribution to the research made by anyone with whom I have worked at Notre Dame of Midsayap College, or elsewhere.

I also declare that this is a true copy of our thesis, including any final changes, as approved by the Researcher Examining Committee.

Abstract

3 single spaces

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum. Sed ut perspiciatis unde omnis iste natus error sit voluptatem accusantium doloremque laudantium, totam rem aperiam, eaque ipsa quae ab illo inventore veritatis et quasi architecto beatae vitae dicta sunt explicabo. Nemo enim ipsam voluptatem quia voluptas sit aspernatur aut odit aut fugit, sed quia consequuntur magni dolores eos qui ratione voluptatem sequi nesciunt. Neque porro quisquam est, qui dolorem ipsum quia dolor sit amet, consectetur, adipisci velit, sed quia non numquam eius modi tempora incidunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim ad minima veniam, quis nostrum exercitationem ullam corporis suscipit laboriosam, nisi ut aliquid ex ea commodi consequatur? Quis autem vel eum iure reprehenderit qui in ea voluptate velit esse quam nihil molestiae consequatur, vel illum qui dolorem eum fugiat quo voluptas nulla pariatur

Keywords: lorem, Ipsum, neque, gord, enim (3-5 words)

The abstract should be a single paragraph containing 150-250 words, and it should follow this outline: purpose of the study, research design and samples, major findings, conclusions, and recommendations. A detailed discussion of the findings is unnecessary, as it would make the abstract too lengthy. Conclusions and recommendations should be concise. The abstract must be informative enough to encourage the reader to read the entire thesis.

The table or figure number should be written in Arabic numerals. A single line spacing is required. However, each table or figure title must be separated with a single line (in this sample, 2 tabs). All tables or figures presented in the study should be listed. They must be numbered systematically as they appear from the first page to the last page.

The background may start with a striking statement which can be in a form of a fact, a quote, or a statistics. The first paragraph should be strong enough to capture the main perspective of the study. The researcher should also establish the trustworthiness of the study by citing credible sources. The first paragraph is crucial because it is where the researcher should inject the element of persuasion to convince the readers that this study will help close gaps, address the existing problems, uncover new insights, and validate existing theories.

The second and succeeding paragraphs will tackle global literature/studies related to the problem and should also include actions taken by various practitioners. Comparison may also be done across countries or continents. National literature/studies related to the problem should also be discussed, including critical analysis to support that the problem is also present in the national level. Lastly, include a local related literature that must be thoroughly analyzed. Just like the global and national issues, the local issue should be compelling and strong enough to establish why this study needs to be done.

Present the research gaps by pointing out limitations, unsolved issues, or underexplored areas of the previous studies. You may begin with a general statement about what is known, then narrow down to what is not known.

Once the research gaps are identified, highlight specific issues/problems that your study aims to address. Take note, the problem must stem from the gaps identified and connect them logically to establish the worth of the study.

After identifying the gaps and the problem, justify how your research will help in closing the existing gaps, how it will solve the problem, and explain its potential contribution to the existing body of knowledge.

3 single spaces

Statement of the Problem

3 single spaces

The study sought to determine the relationship of study habits to academic performance of Grade 10 students of Notre Dame of Midsayap College as measured by their Grade Point Average (GPA). Specifically, this study seeks to answer the following questions:

1. What is the study habits of the respondents in terms of:
 - 1.1. Time management
 - 1.2. Memory techniques
2. What is the academic performance of the respondents as measured by their Grade Point Average (GPA)?
3. Is there a significant relationship between the study habits of the respondents and their academic performance?

3 single spaces { **Significance of the Study**

This research aims to provide crucial information and knowledge to the following:

Students. Cite the benefits of this study to the students. Succeeding benefactors may include, teachers, school administrators, research community, etc.

Teachers. Cite the benefits of this study to the students. Succeeding benefactors

may include, teachers, school administrators, research community, etc.

3 single spaces { **Scope and Delimitations of the Study**

3 single spaces { The scope and delimitation of a study defines the boundaries and parameters of the research, and is typically established early in the research process. Scope includes details about what the study will explore, such as the target population, extent, or study duration while delimitations are the factors and variables that will not be included in the study

Definition of Terms

There are two ways to define a term used in the study—conceptual/lexical and/or operational. The definition of terms should start with a short introductory statement.

Academic performance. Refers to the grade point average of the respondents. In defining a term/word, the researcher may start with a lexical definition, followed by the operational definition or it can be purely operational definition. Operational definition refers to how the researcher/s used the term in their study. The terms should also be arranged alphabetically.

3 single spaces {

Review of Related Literature

The Academic Performance of College Students

The RRL is an important part of the research process because it helps the researcher understand the current knowledge on the topic, formulate an appropriate hypothesis, avoid duplicating previous efforts, and ensure that the research is accurate and valid (How Does the Review of Related Literature (RRL) Help the Accuracy and Validity of the Research? | Editage Insights, 2022).

The Academic Performance of College Students Based on Grade Point Average. Indented, boldface, title case heading ending with a period. In level 3 heading, your paragraph begins right here, in line with the heading. In addition, a RRL typically involves summarizing the most relevant aspects of existing research while doing critical analysis of its strengths and weaknesses. This may include identifying errors or limitations of the previous studies and providing synthesis of the key findings as a way to acknowledge the contributions of the different researchers to the field. RRL also highlights the potential gaps or areas of disagreement in the RL which helps set the direction of the research.

Student performance in mathematics. Indented, boldface, italicize, sentence case paragraph heading ending with a period. In level 4 heading, your paragraph begins right here, in line with the heading.

However, this section is often mistaken as discussion of the concepts related to the study. This is NOT a conceptual review but rather, a literature review. One should note that this section is a critical analysis of the results of related studies conducted before. However, if the concepts are broad, a brief discussion of the concepts is needed to clarify the terms.

In writing this section, planning is essential. Thorough research is needed to gather results of related studies. The process of writing starts with identifying the major arguments and finding supporting details for each argument. While doing this, a focus on the research problems is necessary.

The researcher must clearly identify key arguments before writing. These arguments must support the claim that the study conducted is original and is not a replication of previously conducted studies. This is the main aim why this section is a major part of introduction. If this portion is weak, the whole study can be perceived as just a product of shallow thinking or just a mere duplication of previous studies.

To strengthen this section, the elements of argumentation are requisites. For every argument, support it by elaborating through giving examples, comparing and contrasting results of previous studies, and giving personal observation. Researchers must take extra care in citing literatures because plagiarism is often committed. To avoid this, the rules in citing ideas of other authors must be carefully observed, like the following:

1. Paraphrase – arguments/ ideas of other authors must be paraphrased in order to avoid plagiarism. This requires stating the work of other people using different words and changing the organization (order of sentences and ideas) of the statement.
2. Direct quotes should be used only when the original phrasing is unique and cannot be paraphrased without changing the meaning. When using a short quote (3 lines or less than 40 words) it must be integrated in the text. It must be introduced with a complete sentence and a colon, then the whole quote must be italicized or be enclosed with a quotation mark. For quotation longer than 3 lines, it must be written in single space, indented, not in quotation mark and be referenced at the start or at the end.

In citing the source of the literature, variation in style is expected. There are two ways by which the quotation or idea of other authors can be cited. One is the information-prominent, where the surname of the author with the year of publication is written at the end of the idea enclosed with a parenthesis. For example:

Literature review is a discussion of previously written studies (Alonzo, 2010).

Another way to cite the source of the idea is the author-prominent where emphasis is given to the person who made the proposition. This style is highly suggested if the author is well known in the field for this adds credibility to the information. This style also can be done in several ways by using various discourse signals. Words that can be used include:

○ Claims ○ Argues ○ Asserts ○ Speculates ○ Confirms ○ Mentions ○ Suggests ○ Mentions ○ Admits ○ Agrees/disagrees ○ Proposes	○ Defines ○ Affirms ○ Maintains ○ Assumes ○ Points out ○ Concludes ○ Implies ○ Highlights ○ Observes ○ Disputes ○ More!!!
---	---

Sources from the internet must be cited the way information from the books or journals is cited. If the article contains the name of the author, the family name and year format must be used. If not, the name of the organization, year format must be used. If the name of the author is unknown and the publisher is not given, this literature must not be included because the source is not reliable. Incompetent researchers are tempted to use the information while citing the web address. This is not a professional practice in research.

This section must be concluded by a paragraph summarizing the major arguments presented. Advancing herein, that the study in particular bridges the gap in the existing literature.

*Note: as agreed, following the APA format, when citing about the work, past tense must be used.

Example: *This is supported by the work of Cruz (2020) where he tested the effect of study habits....*

However, if ideas, concepts and results of the study are the ones being discussed, the present tense is preferred.

Example: *Romualdez (2023) argues that academic performance is based on...*

Excerpt from: College of Education Faculty (2011)

Theoretical Framework

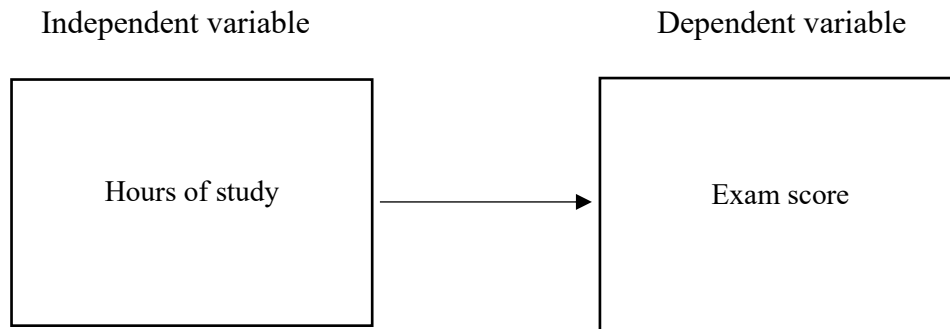

A theoretical framework is a foundational review of existing theories where the researcher can anchor his study. In this part, the researcher can use a maximum of two theories—one major and one minor.

Conceptual Framework

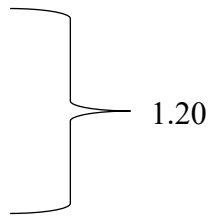

A conceptual framework is a visual or written representation of the expected relationships between variables in a research study. Additional information on how to develop conceptual framework can be found in this link:
<https://www.youtube.com/watch?v=MnfRdTCUIsc&t=4s>

Figure 1

The Schematic Diagram of the Study

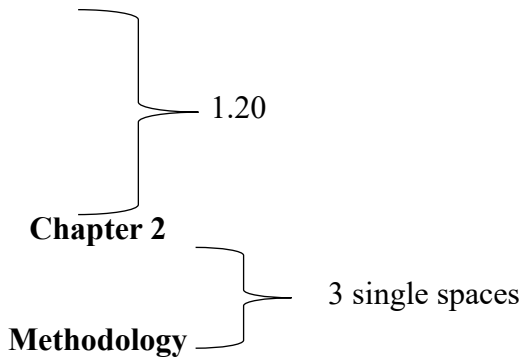

The conceptual framework represents the synthesis of key concepts derived from various theories. It serves as the foundation of the study, illustrating the interaction between the variables under investigation. Each variable included is drawn from the theories discussed and must be operationally defined in this section.

1.20

Hypothesis

There are two types of hypothesis but the ones presented in the study is the null hypothesis denoted by the symbol H_0 . It is written in negative form.

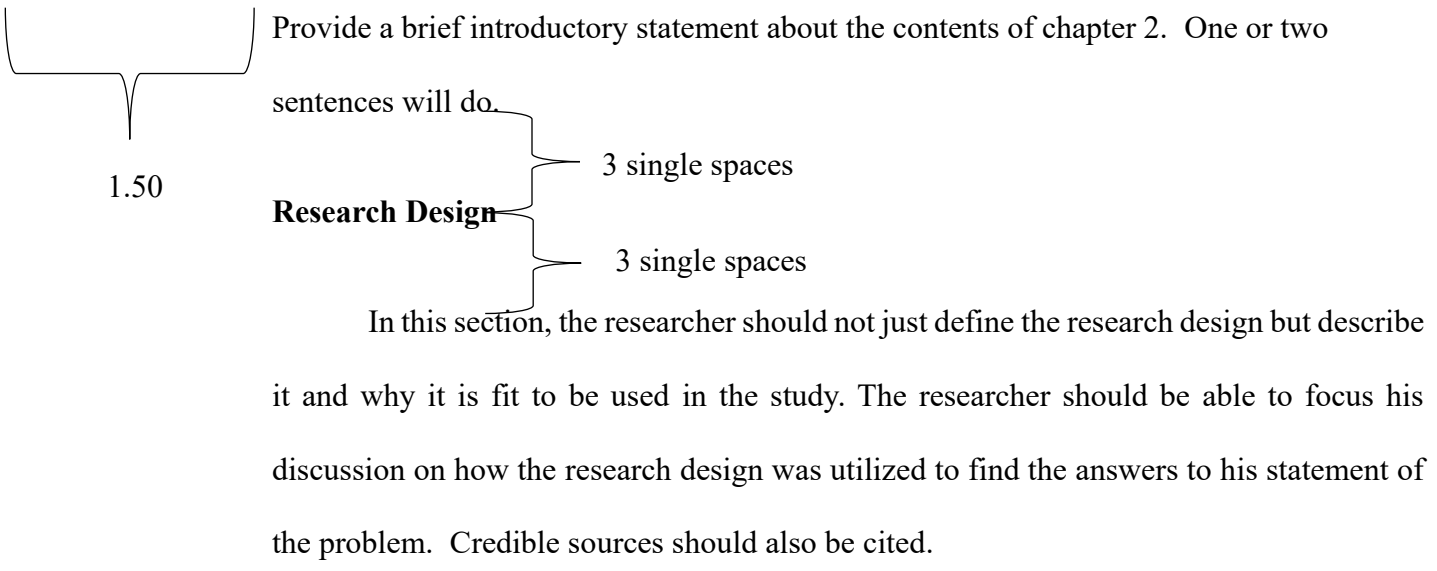

Chapter 2

Methodology

1.20

3 single spaces

1.50

Provide a brief introductory statement about the contents of chapter 2. One or two sentences will do.

Research Design

3 single spaces

3 single spaces

In this section, the researcher should not just define the research design but describe it and why it is fit to be used in the study. The researcher should be able to focus his discussion on how the research design was utilized to find the answers to his statement of the problem. Credible sources should also be cited.

Locale and Respondents of the Study

3 single spaces

The locale of a study is the location where the research was conducted, while the respondents are the individuals who provide responses to the research.

Sampling Technique

This section discusses how the respondents were selected. The selection of the total number of respondents/ participants must be clearly outlined to show that the samples are true representative of the population.

Instrumentation

A research instrument can include interviews, tests, surveys, or checklists. The Research Instrument is usually determined by researcher and is tied to the study methodology.

Validity and Reliability of the Instruments

Validity measures how well an instrument measures what it intends to measure. Validity is associated with accuracy while reliability measures how consistent and stable an instrument's results are. Reliability is associated with consistency. A measurement must be reliable to be valid, but a measurement can be reliable without being valid. Two common reliability tests are Cronbach's alpha and factor analysis. Cronbach's alpha measures the internal consistency of scales. A high Cronbach's alpha value may indicate high reliability, but it may also indicate that the answers may affect each other. If the questionnaire used is adopted, then its characteristics (reliability and validity) must be presented.

In the case of researcher-made questionnaire, the process of development should be clearly outlined and discussed. The focus of discussion should be the reliability and validity of the instruments.

In cases where the questionnaire is researcher-made, the process of questionnaire development should be outlined as follows:

1. Identify the domains of each variable aligned with your problem.
2. Identify the indicators of each domain from your literature review.

3. Develop test items for each indicator.
4. Pilot test the questionnaire with samples similar to your subject.
5. Analyze the result of the pilot test.
6. Revise the questionnaire based on the result of the pilot test.
7. Re-test the revised questionnaire to determine the reliability index of the questionnaire.

All these seven steps must be elaborated in this section of the study. The veracity of research findings depends on how valid and reliable the instruments are.

Source: USEP-CEd Faculty Guidelines in Thesis/Dissertation Writing (2011)

Data Gathering Procedure

This part should include how the permits are secured from the proper authorities before the survey. This should also include how the assessment (testing, retrieval, recording) was conducted and how the data collected have been managed.

Statistical Tools and Treatment of Data

All statistical tools should be explicitly discussed in this section. The focus of the discussion should be the utilization of each statistical tool in treating the different variables of the study. The software used should also be presented in this section.

Ethical Consideration

Ethical considerations in research papers should include a range of principles and practices that protect the rights of participants and maintain scientific integrity. You may refer to the Belmont report of 1978.

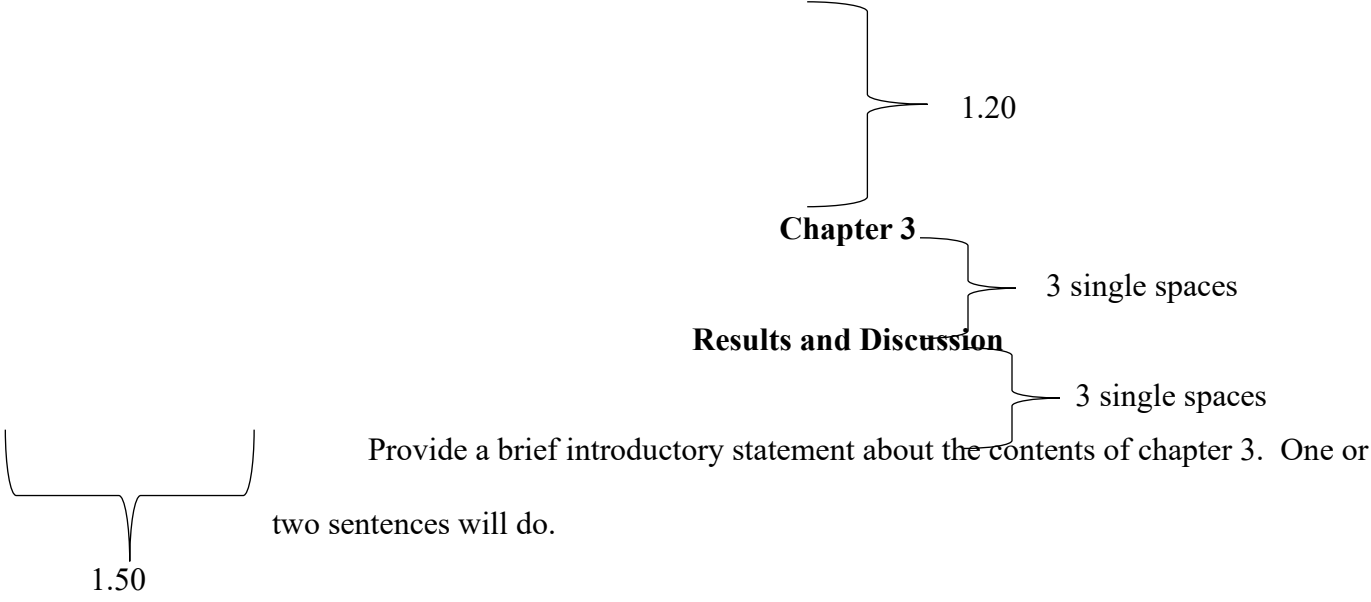

Table Format

Introduce the table first before presenting the table. DO NOT USE the title of the table as the side heading for the introduction. In the discussion of the data in the table, the researcher can look for the data with the highest and lowest values (2-3 each), or those with zero responses.

Table 1

Lakatan Production in Midsayap

Barangay	Lakatan Produced (no. of tonnes)	Percentage
Poblacion 2	145.05	20%
Poblacion 5	200.45	25%
Villarica	89.0	9%

Note: Other barangays were removed from the analysis because they do not produce lakatan for exportation.

The results may be presented through tables, graphs, and figures to highlight key data points, and organize the information in a logical flow that aligns with your research objectives. Focus on the most significant results, summarize patterns or trends, and provide a brief description of each figure or table to guide the reader. After presenting the result and its meaning, this should be followed by the implications of the findings, backed by

previous studies or theories. A good approach is to compare and contrast the current study’s findings with those of other research. However, researchers must exercise caution—excessive comparison can undermine the strength of their own findings. It is important to remember that the discussion should convince readers of the study’s credibility.

In addition, a graph should not duplicate in results because it creates confusion and misleads the viewer by presenting the same information twice, essentially exaggerating the data and making it difficult to interpret the true trends or patterns within the data; it is considered poor data visualization practice to repeat information across different visual elements like tables and graphs (Alexander et al , 2024; The Writing Center - University of North Carolina at Chapel Hill, 2024).

Respondents’ Level of Preparedness in Disaster Risk Reduction and Management

Provide a brief description of the table below.

Table 2

Level of Preparedness of the Respondents

Statement	Mean	SD	Description	Interpretation
1. I am aware of the emergency action plan within our school.	4.18	.709	Agree	Prepared
2. I know the procedure for evacuating students during a fire, typhoon and earthquake emergency.	4.27	.634	Strongly Agree	Highly Prepared
3. I regularly review disaster preparedness information with my students.	3.97	.823	Agree	Prepared

The statement no. 2, *I know the procedure for evacuating students during a fire, typhoon and earthquake emergency*, has the highest mean (M=4.18, SD=.709) and

interpreted as *Highly Prepared*. After presenting the result and its meaning, evaluate its implications backed by previous studies or theories from your RRL.

For more information on how to present statistical results, please refer to the links below:

Chapter 4

1.20

3 single spaces

Summary of Findings, Conclusion, and Recommendations

Provide a brief introductory statement about the contents of chapter 4. One or two sentences will do.

1.50

Summary of Findings

3 single spaces

Present the findings of the study in a clear, concise and systematic manner without interpretation. This section also shows how the results align with the research questions or hypotheses posed in the study.

3 single spaces

Conclusion

3 single spaces

A conclusion provides a brief and concise interpretation of the results of your research in a way that stresses the significance of your study. Start by restating your topic, your thesis, summarize the main points of your research, and connect the significance of the main points, and you may finish up by creating a call to action or pose an idea that gets your readers thinking further about your argument (Eads, 2024).

3 single spaces

Recommendations

Recommendations should be clear and include rational suggestions with actionable words about what can be done further in a particular area or field being studied.

INSTRUCTIONS FOR HARD BOUND

Figure 1

Front hard cover

1. For the front hard cover, follow the same format and structure as shown above. In cases where there are more than two authors, the space between the seal and the first author can be adjusted and/or the names can be arranged in two columns.
2. The color of the casing shall depend on the College to which the researchers belong. The table below shows the Colleges and their respective casing colors:

Table 1

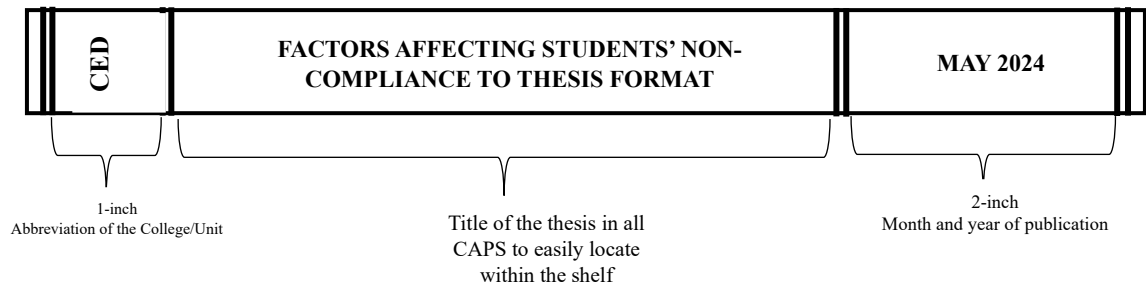

Casing color per college

COLLEGE	COLOR
Graduate Studies	Matte Black
College of Education	NDMC Green
College of Arts and Sciences	Royal Blue
College of Nursing	White
College of Business and Accountancy	Golden Yellow
College of Criminal Justice Education	Maroon
College of Information Technology and Engineering	Gray

- For the spine, the top and bottom edges shall be bordered by two gold lines as indicated in the figure below:

Figure 2

The spine design

- For Graduate School, instead of the month and year of publication, replace with the full-name of the author.
